Many of today's daybeds employ a linkspring as the support system for the mattress. The linkspring is a rectangular metal frame (roughly the footprint of the mattress) with cross supports. A wire or polyester/nylon mesh held in place by a network of springs lies across the top of the linkspring. The linkspring design provides support and creates clearance underneath a daybed for storage. 6cb8d45adb

Bed size Mattress and bedding sizes may not always correspond. Standard bed sizes are based on mattress dimensions, which vary from country to country. Dimensions and terminology differ worldwide, as most countries maintain their own standards. In addition, two mattresses with the same nominal size may have slightly different dimensions due to manufacturing tolerances, padding, and support type. Bed sizes may also vary depending on the design and ornamentation of the bed frame. Most modern beds consist of a soft, cushioned mattress on a bed frame. The mattress rests either on a solid base, often wood slats, or a sprung base. Many beds include a box spring inner-sprung base, which is a large mattress-sized box containing wood and springs that provide additional support and suspension for the mattress. Beds are available in many sizes, ranging from infant-sized bassinets and cribs, to small beds for a single person, to large queen and king-size beds designed for two people. While most beds are single mattresses on a fixed frame, there are other varieties, such as the murphy bed, which folds into a wall; the sofa bed, which folds out of a sofa; the trundle bed, which is stored under a low, twin-sized bed and can be rolled out to create a larger or second sleeping area; and the bunk bed, which provides two mattresses on two tiers as well as a ladder to access the upper tier. Temporary beds include the inflatable air mattress and the folding camp cot. Some beds contain neither a padded mattress nor a bed frame, such as the hammock. Other beds are made specifically for animals. 6cb8d45adb

Raised beds lend themselves to the development of complex agriculture systems that utilize many of the principles and methods of permaculture. They can be used effectively to control erosion and recycle and conserve water and nutrients by building them along contour lines on slopes. This also makes more space available for intensive crop production. They can be created over large areas with the use of several commonly available tractor-drawn implements and efficiently maintained, planted and harvested using hand tools. 6cb8d45adb
