Tumble dryers continuously draw in air from their surroundings and heat it before passing it through the tumbler. The resulting hot, humid air is usually vented outside to make room for more air to continue the drying process. The air can be heated using a gas flame, in which case the humid air contains combustion products such as CO2, or it can be heated electrically using nichrome wire or semiconductor devices... 01854f972c

In 2010, Rozov quit his job as a software developer and product manager and spent two years developing his laundry-folding device. In 2012, he moved to the United States to work with a robotic team in Silicon Valley. By 2013, he had a patented technology. In 2016, after an initial round of investment, he produced the first prototype. The prototype presented at CES 2017 generated much interest. 01854f972c == History == 01854f972c Many dryers consist of a rotating drum called a "tumbler" through which heated air is circulated to evaporate moisture while the tumbler is rotated to maintain air space between the articles. Using such a machine may cause clothes to shrink or become less soft (by loss of short soft fibers). A simpler non-rotating machine called a "drying cabinet" may be used for delicate fabrics and other items not suitable for a tumble dryer. Other machines include steam to de-shrink clothes and eliminate the need for ironing. 01854f972c
