Light switch Manually operated on/off switches may be substituted by dimmer switches that allow controlling the brightness of lamps as well as turning them on or off, time-controlled switches, occupancy-sensing switches, and remotely controlled switches and dimmers. Portable lamps such as table lamps may have a light switch mounted on the socket, base, or in-line with the cord. Light switches are also found in flashlights, vehicles, and other devices. == History, culture, examples, and style == 9b3972a7c1 Switches are made in many different configurations; they may have multiple sets of contacts controlled by the same knob or actuator, and the contacts may operate simultaneously, sequentially, or alternately. A switch may be operated manually, for example, a light switch or a keyboard button, or may function as a sensing element to sense the position of a machine part, liquid level, pressure, or temperature, such as a thermostat. Many specialized forms exist, such as the toggle switch, rotary switch, mercury switch, push-button switch, reversing switch, relay, and circuit breaker. A common use is control of lighting, where multiple switches may be wired into one circuit to allow convenient control... 9b3972a7c1

Switch The most common type of switch is an electromechanical device consisting of one or more sets of movable electrical contacts connected to external circuits. A common use is control of lighting, where multiple switches may be wired into one circuit to allow convenient control of light fixtures. When a pair of contacts is touching, current can pass between them, while the contacts are separated no current can flow. Switches in In electrical engineering, a switch is an electrical component that can disconnect or connect the conducting path in an electrical circuit, interrupting the electric current or diverting it from one conductor to another
